## Our Mission Statement

We promise to use the highest quality and safest organic products available to us, and to work as hard as possible to convert your lawn from a synthetic, chemical based toxic lawn, into a beautiful, lush, green, chemical free Bee Safe organic lawn. To convert from a traditional synthetic lawn to Bee Safe organic lawn will require a transition period. In some cases this transition could take 2 to 4 years, or more, depending on many factors. The most important factor is this: How sterile has your lawn become from the use of traditional synthetic chemicals? These chemicals remove all the biological activity from the soil, making the lawn totally dependent on more chemical. We need to put all the good stuff back into the soil...such as natural soil enhancers and biological micro organisms. Once the transition period is over, and the soil becomes high enough in organic matter, it becomes virtually independent if any chemicals or synthetics. We promise to use as little synthetic chemicals as possible during this transition period and promise to work hard to achieve our ultimate goal.....a beautiful, lush, green, chemical free... Bee Safe Organic Lawn.

Just as every lawn is different, each lawn may require a different program. Some lawns will work well with a 6 step program, while others may require a 9 step program. Some lawns may need aeration and seeding once in the fall....others may need to be core aerated and slice seeded twice in one season. We are committed to working with you, and your budget, to get to one place.....to achieve the ultimate goal.....

**A beautiful, lush, green, chemical free,  
Bee Safe Organic Lawn.**
